**Caution:** Exceeding the maximum indicated flow rate for power injection of contrast agent.

**Internal catheter pressure during power injection with injector safety cut-off at 254 psi, using contrast media with 11.8 cP viscosity.**

**Maximum burst pressure is the static burst pressure of the catheter.**

**Warning:** Only a physician familiar with the appropriate techniques should attempt the following procedures.

**Note:** The patient should be in a modified Trendelenburg position.

**Warning:** Review hospital or unit protocol, potential complications and their treatment, warnings, and precautions prior to undertaking any type of mechanical or chemical intervention in response to this performance protocol.

**Note:** The patient should be in a modified Trendelenburg position.
